Acknowledgements

The author thanks Khushi Mhamane for rigorous technical insights and critical feedback during manuscript preparation. The author acknowledges the open-source scientific community for the computational tools (NetworkX, Ripser, XGBoost, SHAP, Optuna, scikit-learn) that made this analysis possible.

Declaration of Conflicting Interest

The author declares no competing financial or non-financial interests.

Funding Statement

This research received no external funding.

Ethical Approval and Informed Consent

No ethical approval was required. All data used are publicly available, de-identified datasets retrieved from the NCBI Gene Expression Omnibus (GEO). No human participants were recruited.

Data Availability Statement

All datasets are publicly available from NCBI GEO under accession numbers GSE73002, GSE115513, GSE126094, and GSE101684. Processed feature matrices, the topology sensitivity diagnostic script (`sensitivity_analysis_topology.py`), and the dataset-stratified cross-validation pipeline (`classify_nested_cv.py`) are available at <https://github.com/Sharon-codes/Cancer-Research-JBI>.
